Dear Hiring Committee,

I am eager to apply for the Software Development Principal Engineer position at Quest Software Canada. With a foundation in Python-based systems development and data automation, I bring a strong analytical mindset and an eagerness to expand into large-scale cloud application engineering.

In my current role as a Process Analyst, I design and build data tools that streamline reporting and operational processes, integrating SQL, Access, and Python to automate tasks and deliver real-time insights. Working in a small company has given me full-cycle ownership — from user requirements and database design to implementation, testing, and training — and honed my ability to adapt quickly to new technologies.

While my professional experience has centered around Python and SQL, I am actively building proficiency in C#/.NET and TypeScript through self-directed projects and coursework. I have consistently demonstrated the ability to master complex technologies independently and would be excited to apply that same drive within Quest's modern engineering environment.

I am inspired by Quest's commitment to innovation, cloud-native design, and technical excellence. I would welcome the opportunity to contribute to your Azure-based initiatives while growing within a team that values curiosity, collaboration, and continuous learning.

Sincerely
Avery Briggs
